

## WIDE RATIO TRANSMISSIONS HAVING THREE PLANETARY GEAR SETS AND THREE BRAKES

### TECHNICAL FIELD

[0001] The present invention relates to a family of power transmissions having three planetary gear sets that are controlled by seven torque-transmitting devices to provide at least eight forward speed ratios and at least one reverse speed ratio.

### BACKGROUND OF THE INVENTION

[0002] Passenger vehicles include a powertrain that is comprised of an engine, multi-speed transmission, and a differential or final drive. The multi-speed transmission increases the overall operating range of the vehicle by permitting the engine to operate through its torque range a number of times. The number of forward speed ratios that are available in the transmission determines the number of times the engine torque range is repeated. Early automatic transmissions had two speed ranges. This severely limited the overall speed range of the vehicle and therefore required a relatively large engine that could produce a wide speed and torque range. This resulted in the engine operating at a specific fuel consumption point during cruising, other than the most efficient point. Therefore, manually-shifted (countershaft transmissions) were the most popular.

[0003] With the advent of three- and four-speed automatic transmissions, the automatic shifting (planetary gear) transmission increased in popularity with the motoring public. These transmissions improved the operating performance and fuel economy of the vehicle. The increased number of speed ratios reduces the step size between ratios and therefore improves the shift quality of the transmission by making the ratio interchanges substantially imperceptible to the operator under normal vehicle acceleration.

[0004] It has been suggested that the number of forward speed ratios be increased to six or more. Six-speed transmissions are disclosed in U.S. Patent No. 4,070,927 issued to Polak on

January 31, 1978; and U.S. Patent No. 6,422,969 issued to Raghavan and Usoro on July 23, 2002.

**[0005]** Six-speed transmissions offer several advantages over four- and five-speed transmissions, including improved vehicle acceleration and improved fuel economy. While many trucks employ power transmissions having six or more forward speed ratios, passenger cars are still manufactured with three- and four-speed automatic transmissions and relatively few five or six-speed devices due to the size and complexity of these transmissions.

**[0006]** Seven-speed transmissions are disclosed in U.S. Patent No. 6,623,397 issued to Raghavan, Bucknor and Usoro. Eight speed transmissions are disclosed in U.S. Patent No. 6,425,841 issued to Haka. The Haka transmission utilizes three planetary gear sets and six torque transmitting devices, including two brakes and two clutches, to provide eight forward speed ratios and a reverse speed ratio. One of the planetary gear sets is positioned and operated to establish two fixed speed input members for the remaining two planetary gear sets. The Haka transmission requires two double-transition shifts. Seven-, eight- and nine-speed transmissions provide further improvements in acceleration and fuel economy over six-speed transmissions. However, like the six-speed transmissions discussed above, the development of seven-, eight- and nine-speed transmissions has been precluded because of complexity, size and cost.

#### SUMMARY OF THE INVENTION

**[0007]** It is an object of the present invention to provide an improved family of transmissions having three planetary gear sets controlled to provide at least eight forward speed ratios and at least one reverse speed ratio.

**[0008]** In one aspect of the present invention, the family of transmissions has three planetary gear sets, each of which includes a first, second and third member, which members may comprise a sun gear, a ring gear, or a planet carrier assembly member.

**[0009]** In referring to the first, second and third gear sets in this description and in the claims, these sets may be counted "first" to "third" in any order in the drawings (i.e., left to right, right to left, etc.). Additionally, the first, second or third members of each gear set may be

counted “first” to “third” in any order in the drawings (i.e., top to bottom, bottom to top, etc.) for each gear set.

[0010] In another aspect of the present invention, planet carrier assembly members of each of the planetary gear sets may be single pinion-carriers or double pinion-carriers.

[0011] In yet another aspect of the present invention, a first member of the first planetary gear set is continuously interconnected to a first member of the second planetary gear set through a first interconnecting member.

[0012] In yet another aspect of the present invention, a second member of the first planetary gear set is continuously interconnected to a second member of the second planetary gear set through a second interconnecting member.

[0013] In yet another aspect of the present invention, a first member of the third planetary gear set is continuously interconnected to a stationary member through a third interconnecting member.

[0014] In yet a further aspect of the invention, each family member incorporates an input shaft which is continuously connected with a member of the planetary gear sets and an output shaft which is continuously connected with another member of the planetary gear sets. The first member of the third planetary gear set continuously interconnected to the stationary member through the third interconnecting member is different from the members of the planetary gear sets continuously interconnected with the input shaft and the output shaft, respectively.

[0015] In still a further aspect of the invention, a first torque-transmitting mechanism, such as a clutch, selectively interconnects a member of the first planetary gear set with a member of the third planetary gear set.

[0016] In another aspect of the invention, a second torque-transmitting mechanism, such as a clutch, selectively interconnects a member of the first planetary gear set with a member of the third planetary gear set. The pair of members interconnected by the first torque-transmitting mechanism is different from the pair of members interconnected by the second torque-transmitting mechanism.

[0017] In a still further aspect of the invention, a third torque-transmitting mechanism, such as a clutch, selectively interconnects a member of the second planetary gear set with a member of the third planetary gear set. The pair of members interconnected by the third torque-transmitting mechanism is different from the pairs of members of the planetary gear sets interconnected by the first and second torque-transmitting mechanisms, respectively.

[0018] In a still further aspect of the invention, a fourth torque-transmitting mechanism, such as a clutch, selectively interconnects a member of the second planetary gear set with a member of the third planetary gear set. The pair of members interconnected by the fourth torque-transmitting mechanism is different from the pairs of members of the planetary gear sets interconnected by the first, second and third torque-transmitting mechanisms, respectively.

[0019] In a still further aspect of the invention, a fifth torque-transmitting mechanism, such as a brake, selectively interconnects a member of the first planetary gear set with the stationary member. The member of the first planetary gear set interconnected with the stationary member by the fifth torque-transmitting mechanism is different from the members of the planetary gear sets continuously interconnected with the input shaft and the output shaft, respectively.

[0020] In still another aspect of the invention, a sixth torque-transmitting mechanism, such as a brake, selectively interconnects a member of the first planetary gear set with the stationary member. The member of the first planetary gear set interconnected with the stationary member by the sixth torque-transmitting mechanism is different from the members of the planetary gear sets continuously interconnected with the input shaft and the output shaft, respectively.

[0021] In still another aspect of the invention, a seventh torque-transmitting mechanism, such as a brake, selectively interconnects a member of the second planetary gear set with the stationary member. The member of the second planetary gear set interconnected with the stationary member by the seventh torque-transmitting mechanism is different than the members of the planetary gear sets continuously interconnected with the input shaft and the output shaft, respectively.

[0022] In still another aspect of the invention, the seven torque-transmitting mechanisms are selectively engageable in combinations of two to yield at least eight forward speed ratios and at least one reverse speed ratio.

[0023] The resulting transmission provides a significantly wider ratio spread in comparison to transmissions with fewer speed ratios.

[0024] The above features and other features and advantages of the present invention are readily apparent from the following detailed description of the best modes for carrying out the invention when taken in connection with the accompanying drawings.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0051] Referring to the drawings, wherein like characters represent the same or corresponding parts throughout the several views, there is shown in Figure 1a a powertrain 10 having a conventional engine and torque converter 12, a planetary transmission 14, and a conventional final drive mechanism 16.

[0052] The planetary transmission 14 includes an input shaft 17 continuously connected with the engine and torque converter 12, a planetary gear arrangement 18, and an output shaft 19 continuously connected with the final drive mechanism 16. The planetary gear arrangement 18 includes three planetary gear sets 20, 30 and 40.

[0053] The planetary gear set 20 includes a sun gear member 22, a ring gear member 24, and a planet carrier assembly 26. The planet carrier assembly 26 includes a plurality of pinion gears 27 rotatably mounted on a carrier member 29 and disposed in meshing relationship with both the sun gear member 22 and the ring gear member 24.

[0054] The planetary gear set 30 includes a sun gear member 32, a ring gear member 34, and a planet carrier assembly member 36. The planet carrier assembly member 36 includes a plurality of pinion gears 37 rotatably mounted on a carrier member 39 and disposed in meshing relationship with both the sun gear member 32 and the ring gear member 34.

[0055] The planetary gear set 40 includes a sun gear member 42, a ring gear member 44, and a planet carrier assembly member 46. The planet carrier assembly member 46 includes a plurality of pinion gears 47 rotatably mounted on a carrier member 49 and disposed in meshing relationship with both the sun gear member 42 and the ring gear member 44.

[0056] The planetary gear arrangement also includes seven torque-transmitting mechanisms 50, 52, 54, 56, 57, 58 and 59. The torque-transmitting mechanisms 50, 52, 54 and 56 are rotating-type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 57, 58 and 59 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[0057] The input shaft 17 is continuously connected with the sun gear member 22, and the output shaft 19 is continuously connected with the sun gear member 42. The ring gear member 24 is continuously connected with the planet carrier assembly member 36 through the interconnecting member 70. The planet carrier assembly member 26 is continuously connected with the sun gear member 32 through the interconnecting member 72. The planet carrier assembly member 46 is continuously connected with the transmission housing 60 through the interconnecting member 74.

[0058] The planet carrier assembly member 36 is selectively connectable with the ring gear member 44 through the clutch 50. The planet carrier assembly member 36 is selectively connectable with the sun gear member 42 through the clutch 52. The sun gear member 32 is selectively connectable with the sun gear member 42 through the clutch 54. The ring gear member 34 is selectively connectable with the ring gear member 44 through the clutch 56. The ring gear member 24 is selectively connectable with the transmission housing 60 through the brake 57. The planet carrier assembly member 26 is selectively connectable with the transmission housing 60 through the brake 58. The ring gear member 34 is selectively connectable with the transmission housing 60 through the brake 59.

[0059] As shown in Figure 1b, and in particular the truth table disclosed therein, the torque-transmitting mechanisms are selectively engaged in combinations of two to provide eight forward speed ratios (as well as an extra third forward speed ratio (3') and an extra fourth forward speed ratio (4')) and three reverse speed ratios.

[0060] The third reverse (Reverse 3) speed ratio is established with the engagement of the clutch 50 and the brake 59. The clutch 50 connects the planet carrier assembly member 36 with the ring gear member 44, and the brake 59 connects the ring gear member 34 with the

transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 rotates at the same speed as the sun gear member 32. The ring gear member 24 and the planet carrier assembly member 36 rotate at the same speed as the ring gear member 44. The ring gear member 24 rotates at a speed determined from the speed of the sun gear member 22, the speed of the planet carrier assembly member 26 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The ring gear member 34 does not rotate. The planet carrier assembly member 36 rotates at a speed determined from the speed of the sun gear member 32 and the ring gear/sun gear tooth ratio of the planetary gear set 30. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the third reverse (Reverse 3) speed ratio is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20, 30, and 40.

**[0061]** The second reverse (Reverse 2) speed ratio is established with the engagement of the clutch 52 and the brake 58. The clutch 52 connects the planet carrier assembly member 36 with the sun gear member 42, and the brake 58 connects the planet carrier assembly member 26 with the transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 and the sun gear member 32 do not rotate. The ring gear member 24, the planet carrier assembly member 36 and the sun gear member 42 rotate at the same speed as the output shaft 19. The ring gear member 24, and therefore the output shaft 19, rotates at a speed determined from the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The numerical value of the reverse #2 speed ratio is determined utilizing the ring gear/sun gear tooth ratio of the planetary gear set 20.

**[0062]** The first reverse (Reverse 1) speed ratio is established with the engagement of the clutches 50 and 56. The clutch 50 connects the planet carrier assembly member 36 with the ring gear member 44, and the clutch 56 connects the ring gear member 34 with the ring gear member 44. The planetary gear set 20, the planetary gear set 30 and the ring gear member 44 rotate at the

same speed as the input shaft 17. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the first reverse speed ratio (Reverse 1) is determined utilizing the ring gear/sun gear tooth ratio of the planetary gear set 40.

[0063] The first forward speed ratio is established with the engagement of the clutches 52 and 56. The clutch 52 connects the planet carrier assembly member 36 with the sun gear member 42, and the clutch 56 connects the ring gear member 34 with the ring gear member 44. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 rotates at the same speed as the sun gear member 32. The ring gear member 24 and the planet carrier assembly member 36 rotate at the same speed as the sun gear member 42. The ring gear member 24 rotates at a speed determined from the speed of the planet carrier assembly member 26, the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The ring gear member 34 rotates at the same speed as the ring gear member 44. The ring gear member 34 rotates at a speed determined from the speed of the planet carrier assembly member 36, the speed of the sun gear member 32 and the ring gear/sun gear tooth ratio of the planetary gear set 30. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the first forward speed ratio is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20, 30 and 40.

[0064] The second forward speed ratio is established with the engagement of the clutch 52 and the brake 59. The clutch 52 connects the planet carrier assembly member 36 with the sun gear member 42, and the brake 59 connects the ring gear member 34 with the transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 rotates at the same speed as the sun gear member 32. The ring gear

member 24, the planet carrier assembly member 36 and the sun gear member 42 rotate at the same speed as the output shaft 19. The ring gear member 24 rotates at a speed determined from the speed of the planet carrier assembly member 26, the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The sun gear member 34 does not rotate. The planet carrier assembly member 36, and therefore the output shaft 19, rotates at a speed determined from the speed of the sun gear member 32 and the ring gear/sun gear tooth ratio of the planetary gear set 30. The numerical value of the second forward speed ratio is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20 and 30.

[0065] The third forward speed ratio is established with the engagement of the clutches 50 and 54. The clutch 50 connects the planet carrier assembly member 36 with the ring gear member 44, and the clutch 54 connects the sun gear member 32 with the sun gear member 42. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 and the sun gear member 32 rotate at the same speed as the sun gear member 42. The ring gear member 24 and the planet carrier assembly member 36 rotate at the same speed as the ring gear member 44. The ring gear member 24 rotates at a speed determined from the speed of the planet carrier assembly member 26, the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the third forward speed ratio is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20 and 40.

[0066] The extra third forward speed ratio (3') is established with the engagement of the clutch 56 and the brake 57. The clutch 56 connects the ring gear member 34 with the ring gear member 44, and the brake 57 connects the ring gear member 24 with the transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 rotates at the same speed as the sun gear member 32. The ring gear member 24 and the planet carrier assembly member 36 do not rotate. The planet carrier

assembly member 26 rotates at a speed determined from the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The ring gear member 34 rotates at the same speed as the ring gear member 44. The ring gear member 34 rotates at a speed determined from the speed of the sun gear member 32 and the ring gear/sun gear tooth ratio of the planetary gear set 30. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the extra third forward speed ratio (3') is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20, 30 and 40.

[0067] The fourth forward speed ratio is established with the engagement of the clutches 54 and 56. The clutch 54 connects the sun gear member 32 with the sun gear member 42, and the clutch 56 connects the ring gear member 34 with the ring gear member 44. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 and the sun gear member 32 rotate at the same speed as the sun gear member 42. The ring gear member 24 rotates at the same speed as the planet carrier assembly member 36. The ring gear member 24 rotates at a speed determined from the speed of the planet carrier assembly member 26, the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The ring gear member 34 rotates at the same speed as the ring gear member 44. The ring gear member 34 rotates at a speed determined from the speed of the planet carrier assembly member 36, the speed of the sun gear member 32 and the ring gear/sun gear tooth ratio of the planetary gear set 30. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the fourth forward speed ratio is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20, 30 and 40.

[0068] The extra fourth forward speed ratio (4') is established with the engagement of the clutch 54 and the brake 57. The clutch 54 connects the sun gear member 32 with the sun gear member 42, and the brake 57 connects the ring gear member 24 with the transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft 17. The ring gear member 24 and the planet carrier assembly member 36 do not rotate. The planet carrier assembly member 26, the sun gear member 32 and the sun gear member 42 rotate at the same speed as the output shaft 19. The planet carrier assembly member 26, and therefore the output shaft 19, rotates at a speed determined from the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The numerical value of the extra fourth forward speed ratio (4') is determined utilizing the ring gear/sun gear tooth ratio of the planetary gear set 20.

[0069] The fifth forward speed ratio is established with the engagement of the clutch 54 and the brake 59. The clutch 54 connects the sun gear member 32 with the sun gear member 42, and the brake 59 connects the ring gear member 34 with the transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26, the sun gear member 32 and the sun gear member 42 rotate at the same speed as the output shaft 19. The ring gear member 24 rotates at the same speed as the planet carrier assembly member 36. The ring gear member 24 rotates at a speed determined from the speed of the planet carrier assembly member 26, the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The ring gear member 34 does not rotate. The sun gear member 32, and therefore the output shaft 19, rotates at a speed determined from the speed of the planet carrier assembly member 36 and the ring gear/sun gear tooth ratio of the planetary gear set 30. The numerical value of the fifth forward speed ratio is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20 and 30.

[0070] The sixth forward speed ratio is established with the engagement of the clutch 50 and the brake 58. The clutch 50 connects the planet carrier assembly member 36 with the ring gear member 44, and the brake 58 connects the planet carrier assembly member 26 with the transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft

17. The planet carrier assembly member 26 and the sun gear member 32 do not rotate. The ring gear member 24 and the planet carrier assembly member 36 rotate at the same speed as the ring gear member 44. The ring gear member 24 rotates at a speed determined from the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the sixth forward speed ratio is determined utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20 and 40.

[0071] The seventh forward speed ratio is established with the engagement of the clutch 56 and the brake 58. The clutch 56 connects the ring gear member 34 with the ring gear member 44, and the brake 58 connects the planet carrier assembly member 26 with the transmission housing 60. The sun gear member 22 rotates at the same speed as the input shaft 17. The planet carrier assembly member 26 and the sun gear member 32 do not rotate. The ring gear member 24 rotates at the same speed as the planet carrier assembly member 36. The ring gear member 24 rotates at a speed determined from the speed of the sun gear member 22 and the ring gear/sun gear tooth ratio of the planetary gear set 20. The ring gear member 34 rotates at the same speed as the ring gear member 44. The ring gear member 34 rotates at a speed determined from the speed of the planet carrier assembly member 36 and the ring gear/sun gear tooth ratio of the planetary gear set 30. The planet carrier assembly member 46 does not rotate. The sun gear member 42 rotates at the same speed as the output shaft 19. The sun gear member 42, and therefore the output shaft 19, rotates at a speed determined from the speed of the ring gear member 44 and the ring gear/sun gear tooth ratio of the planetary gear set 40. The numerical value of the seventh forward speed ratio is established utilizing the ring gear/sun gear tooth ratios of the planetary gear sets 20, 30 and 40.

[0072] The eight forward speed ratio is established with the engagement of the clutch 52 and 54. In this configuration, the input shaft 17 is directly connected with the output shaft 19. The numerical value of the eighth forward speed ratio is 1.

[0073] As set forth above, the engagement schedule for the torque-transmitting mechanisms is shown in the truth table of Figure 1b. This truth table also provides an example of speed ratios that are available utilizing the ring gear/sun gear tooth ratios given by way of example in Figure 1b. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 20; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 30; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 40. Also, the chart of Figure 1b describes the ratio steps that are attained utilizing the sample of tooth ratios given. For example, the step ratio between the first and second forward speed ratios is 1.60, while the step ratio between the third reverse speed ratio (Reverse 3) and first forward ratio is -0.42.

[0074] Figure 2a shows a powertrain 110 having a conventional engine and torque converter 12, a planetary transmission 114, and a conventional final drive mechanism 16.

[0075] The planetary transmission 114 includes an input shaft 17 continuously connected with the engine and torque converter 12, a planetary gear arrangement 118, and an output shaft 19 continuously connected with the final drive mechanism 16. The planetary gear arrangement 118 includes three planetary gear sets 120, 130 and 140.

[0076] The planetary gear set 120 includes a sun gear member 122, a ring gear member 124, and a planet carrier assembly 126. The planet carrier assembly 126 includes a plurality of pinion gears 127 rotatably mounted on a carrier member 129 and disposed in meshing relationship with both the sun gear member 122 and the ring gear member 124.

[0077] The planetary gear set 130 includes a sun gear member 132, a ring gear member 134, and a planet carrier assembly member 136. The planet carrier assembly member 136 includes a plurality of pinion gears 137 rotatably mounted on a carrier member 139 and disposed in meshing relationship with both the sun gear member 132 and the ring gear member 134.

[0078] The planetary gear set 140 includes a sun gear member 142, a ring gear member 144, and a planet carrier assembly member 146. The planet carrier assembly member 146 includes a plurality of pinion gears 147 rotatably mounted on a carrier member 149 and disposed in meshing relationship with both the sun gear member 142 and the ring gear member 144.

[0079] The planetary gear arrangement 118 also includes seven torque-transmitting mechanisms 150, 152, 154, 156, 157, 158 and 159. The torque-transmitting mechanisms 150, 152, 154 and 156 are rotating-type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 157, 158 and 159 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[0080] The input shaft 17 is continuously connected with the ring gear member 142, and the output shaft 19 is continuously connected with the planet carrier assembly member 126. The planet carrier assembly member 126 is continuously connected with the ring gear member 134 through the interconnecting member 170. The ring gear member 124 is continuously connected with the planet carrier assembly member 136 through the interconnecting member 172. The ring gear member 144 is continuously connected with the transmission housing 160 through the interconnecting member 174.

[0081] The planet carrier assembly member 136 is selectively connectable with the sun gear member 142 through the clutch 150. The planet carrier assembly member 136 is selectively connectable with the planet carrier assembly member 146 through the clutch 152. The sun gear member 122 is selectively connectable with the sun gear member 142 through the clutch 154. The sun gear member 132 is selectively connectable with the planet carrier assembly member 146 through the clutch 156. The ring gear member 124 is selectively connectable with the transmission housing 160 through the brake 157. The sun gear member 122 is selectively connectable with the transmission housing 160 through the brake 158. The sun gear member 132 is selectively connectable with the transmission housing 160 through the brake 159.

[0082] The truth tables given in Figures 2b, 3b, 4b, 5b, 6b, 7b, 8b, 9b, 10b, 11b, 12b and 13b show the engagement sequences for the torque-transmitting mechanisms to provide at least eight forward speed ratios and at least one reverse ratio. As shown and described above for the configuration in Figure 1a, those skilled in the art will understand from the respective truth tables how the speed ratios are established through the planetary gear sets identified in the written description.

[0083] The truth table of Figure 2b describes the engagement sequence utilized to provide nine forward speed ratios (as well as an extra second (2'), an extra fourth (4') and an extra sixth (6') forward speed ratio) and a reverse speed ratio in the planetary gear arrangement 118 shown in Figure 2a. As shown in the truth table in Figure 2b, the torque-transmitting mechanisms are engaged in combinations of two to establish these speed ratios.

[0084] The truth table of Figure 2b also provides an example of the ratios that can be attained with the family members shown in Figure 2a utilizing the sample tooth ratios given in Figure 2b. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 120; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 130; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 140. Also shown in Figure 2b are the ratio steps between single step ratios in the forward direction as well as the reverse to first ratio step. For example, the first to second step ratio is 1.62. It should also be noted that the single step forward ratio interchanges are of the single transition variety. Additionally, the torque-transmitting mechanism 156 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange.

[0085] Turning to Figure 3a, a powertrain 210 includes the engine and torque converter 12, a planetary transmission 214, and a final drive mechanism 16. The planetary transmission 214 includes an input shaft 17 continuously connected with the engine and torque converter 12, a planetary gear arrangement 218, and an output shaft 19 continuously connected with the final drive mechanism 16. The planetary gear arrangement 218 includes three planetary gear sets 220, 230 and 240.

[0086] The planetary gear set 220 includes a sun gear member 222, a ring gear member 224, and a planet carrier assembly 226. The planet carrier assembly 226 includes a plurality of pinion gears 227 rotatably mounted on a carrier member 229 and disposed in meshing relationship with both the sun gear member 222 and the ring gear member 224.

[0087] The planetary gear set 230 includes a sun gear member 232, a ring gear member 234, and a planet carrier assembly member 236. The planet carrier assembly member 236 includes a plurality of pinion gears 237 rotatably mounted on a carrier member 239 and disposed in meshing relationship with both the sun gear member 232 and the ring gear member 234.

[0088] The planetary gear set 240 includes a sun gear member 242, a ring gear member 244, and a planet carrier assembly member 246. The planet carrier assembly member 246 includes a plurality of pinion gears 247 rotatably mounted on a carrier member 249 and disposed in meshing relationship with both the sun gear member 242 and the ring gear member 244.

[0089] The planetary gear arrangement 218 also includes seven torque-transmitting mechanisms 250, 252, 254, 256, 257, 258 and 259. The torque-transmitting mechanisms 250, 252, 254 and 256 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms, 257, 258 and 259 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[0090] The input shaft 17 is continuously connected with the sun gear member 242, and the output shaft is continuously connected with the ring gear member 234. The ring gear member 224 is continuously connected with the sun gear member 232 through the interconnecting member 270. The planet carrier assembly member 226 is continuously connected with the planet carrier assembly member 236 through the interconnecting member 272. The ring gear member 244 is continuously connected with the transmission housing 260 through the interconnecting member 274.

[0091] The sun gear member 222 is selectively connectable with the planet carrier assembly member 226 through the clutch 250. The planet carrier assembly member 236 is selectively connectable with the sun gear member 242 through the clutch 252. The planet carrier assembly member 236 is selectively connectable with the planet carrier assembly member 246 through the clutch 254. The ring gear member 224 is selectively connectable with the planet carrier assembly member 246 through the clutch 256. The planet carrier assembly member 226 is selectively connectable with the transmission housing 260 through the brake 257. The ring gear member 224 is selectively connectable with the transmission housing 260 through the brake 258. The sun gear member 222 is selectively connectable with the transmission housing 260 through the rake 259.

[0092] The truth table of Figure 3b describes the combinations of engagements utilized for eight forward speed ratios and one reverse ratio. The truth table also provides an example of

speed ratios that are available with the family member described above. These examples of speed ratios are determined utilizing the tooth ratios given in Figure 3b. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 220; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 230; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 240. Also depicted in Figure 3b is a chart representing the ratio steps between adjacent forward speed ratios and the reverse speed ratio. For example, the first to second ratio interchange has a step of 1.66. The torque-transmitting mechanism 256 remains engaged through the neutral position, thus simplifying the forward/reverse interchange.

[0093] A powertrain 310, shown in Figure 4a, includes the engine and torque converter 12, a planetary transmission 314, and the final drive mechanism 16. The planetary transmission 314 includes an input shaft 17 continuously connected with the engine and torque converter 12, a planetary gear arrangement 318, and output shaft 19 continuously connected with the final drive mechanism 16. The planetary gear arrangement 318 includes three planetary gear sets 320, 330 and 340.

[0094] The planetary gear set 320 includes a sun gear member 322, a ring gear member 324, and a planet carrier assembly member 326. The planet carrier assembly member 326 includes a plurality of pinion gears 327 rotatably mounted on a carrier member 329 and disposed in meshing relationship with both the sun gear member 322 and the ring gear member 324.

[0095] The planetary gear set 330 includes a sun gear member 332, a ring gear member 334, and a planet carrier assembly member 336. The planet carrier assembly member 336 includes a plurality of pinion gears 337 rotatably mounted on a carrier member 339 and disposed in meshing relationship with both the sun gear member 332 and the ring gear member 334.

[0096] The planetary gear set 340 includes a sun gear member 342, a ring gear member 344, and a planet carrier assembly member 346. The planet carrier assembly member 346 includes a plurality of pinion gears 347 rotatably mounted on a carrier member 349 and disposed in meshing relationship with both the sun gear member 342 and the ring gear member 344.

[0097] The planetary gear arrangement 318 also includes seven torque-transmitting mechanisms 350, 352, 354, 356, 357, 358 and 359. The torque-transmitting mechanisms 350,

352, 354 and 356 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 357, 358 and 359 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[0098] Input shaft 17 is continuously connected with the sun gear member 342, and the output shaft 19 is continuously connected with the planet carrier assembly member 336. The planet carrier assembly member 326 is continuously connected with the ring gear member 334 through the interconnecting member 370. The sun gear member 322 is continuously connected with the sun gear member 332 through the interconnecting member 372. The ring gear member 344 is continuously connected with the transmission housing 360 through the interconnecting member 374.

[0099] The ring gear member 334 is selectively connectable with the sun gear member 342 through the clutch 350. The ring gear member 334 is selectively connectable with the planet carrier assembly member 346 through the clutch 352. The ring gear member 324 is selectively connectable with the planet carrier assembly member 346 through the clutch 354. The planet carrier assembly member 336 is selectively connectable with the sun gear member 342 through the clutch 356. The planet carrier assembly member 326 is selectively connectable with the transmission housing 360 through the brake 357. The sun gear member 322 is selectively connectable with the transmission housing 360 through the brake 358. The ring gear member 324 is selectively connectable with the transmission housing 360 through the brake 359.

[00100] The truth table shown in Figure 4b describes the engagement combination and the engagement sequence necessary to provide a reverse drive ratio and eight forward speed ratios. A sample of the numerical values for the ratios is also provided in the truth table of Figure 4b. These values are determined utilizing the ring gear/sun gear tooth ratios also given in Figure 4b. The  $N_{R1}/S_{R1}$  value is the tooth ratio for the planetary gear set 320; the  $N_{R2}/S_{R2}$  value is the tooth ratio for the planetary gear set 330; and the  $N_{R3}/S_{R3}$  value is the tooth ratio for the planetary gear set 340. Also given in Figure 4b is a chart describing the step ratios between the adjacent forward speed ratios and the reverse to first forward speed ratio. For example, the first to second

forward speed ratio step is 1.41. The torque-transmitting mechanism 354 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange.

[00101] A powertrain 410, shown in Figure 5a, includes the engine and torque converter 12, a planetary transmission 414 and the final drive mechanism 16. The planetary transmission 414 includes a planetary gear arrangement 418, input shaft 17 and output shaft 19. The planetary gear arrangement 418 includes three simple planetary gear sets 420, 430 and 440.

[00102] The planetary gear set 420 includes a sun gear member 422, a ring gear member 424, and a planet carrier assembly 426. The planet carrier assembly 426 includes a plurality of pinion gears 427 rotatably mounted on a carrier member 429 and disposed in meshing relationship with both the sun gear member 422 and the ring gear member 424.

[00103] The planetary gear set 430 includes a sun gear member 432, a ring gear member 434, and a planet carrier assembly member 436. The planet carrier assembly member 436 includes a plurality of pinion gears 437 rotatably mounted on a carrier member 439 and disposed in meshing relationship with both the sun gear member 432 and the ring gear member 434.

[00104] The planetary gear set 440 includes a sun gear member 442, a ring gear member 444, and a planet carrier assembly member 446. The planet carrier assembly member 446 includes a plurality of pinion gears 447 rotatably mounted on a carrier member 449 and disposed in meshing relationship with both the sun gear member 442 and the ring gear member 444.

[00105] The planetary gear arrangement 418 also includes seven torque-transmitting mechanisms 450, 452, 454, 456, 457, 458 and 459. The torque-transmitting mechanisms 450, 452, 454 and 456 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 457, 458 and 459 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00106] The input shaft 17 is continuously connected with the ring gear member 424 and the output shaft 19 is continuously connected with the ring gear member 444. The planet carrier assembly member 436 is selectively connectable with the ring gear member 444 through the clutch 450. The planet carrier assembly member 436 is selectively connectable with the sun gear member 442 through the clutch 452. The planet carrier assembly member 426 is selectively

connectable with the ring gear member 444 through the clutch 454. The ring gear member 434 is selectively connectable with the sun gear member 442 through the clutch 456. The planet carrier assembly member 436 is selectively connectable with the transmission housing 460 through the clutch 457. The ring gear member 434 is selectively connectable with the transmission housing 460 through the brake 458. The planet carrier assembly member 426 is selectively connectable with the transmission housing 460 through the brake 459.

[00107] The truth table shown in Figure 5b describes the engagement combination and sequence of the torque-transmitting mechanisms 450, 452, 454, 456, 457, 458 and 459 that are employed to provide two reverse drive ratios and nine forward speed ratios.

[00108] Also given in the truth table of Figure 5b is a set of numerical values that are attainable with the present invention utilizing the ring gear/sun gear tooth ratios shown. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 420; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 430; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 440. The torque-transmitting mechanism 456 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange.

[00109] Figure 5b also provides a chart of the ratio steps between adjacent forward ratios and between the second reverse ratio (Reverse 2) and first forward ratio. For example, the ratio step between the first and second forward ratios is 1.66.

[00110] A powertrain 510, shown in Figure 6a, includes an engine and torque converter 12, a planetary gear transmission 514 and the final drive mechanism 16. The planetary transmission 514 includes the input shaft 17, a planetary gear arrangement 518 and the output shaft 19. The planetary gear arrangement 518 includes three planetary gear sets 520, 530 and 540.

[00111] The planetary gear set 520 includes a sun gear member 522, a ring gear member 524, and a planet carrier assembly 526. The planet carrier assembly 526 includes a plurality of pinion gears 527 rotatably mounted on a carrier member 529 and disposed in meshing relationship with both the sun gear member 522 and the ring gear member 524.

[00112] The planetary gear set 530 includes a sun gear member 532, a ring gear member 534, and a planet carrier assembly member 536. The planet carrier assembly member 536 includes a plurality of pinion gears 537 rotatably mounted on a carrier member 539 and disposed in meshing relationship with both the sun gear member 532 and the ring gear member 534.

[00113] The planetary gear set 540 includes a sun gear member 542, a ring gear member 544, and a planet carrier assembly member 546. The planet carrier assembly member 546 includes a plurality of pinion gears 547 rotatably mounted on a carrier member 549 and disposed in meshing relationship with both the sun gear member 542 and the ring gear member 544.

[00114] The planetary gear arrangement 518 also includes seven torque-transmitting mechanisms 550, 552, 554, 556, 557, 558 and 559. The torque-transmitting mechanisms 550, 552, 554 and 556 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 557, 558 and 559 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00115] The input shaft 17 is continuously connected with the sun gear member 522 and the output shaft 19 is continuously connected with the ring gear member 544. The ring gear member 524 is continuously connected with the planet carrier assembly member 536 through the interconnecting member 570. The planet carrier assembly member 526 is continuously connected with the sun gear member 532 through the interconnecting member 572. The planet carrier assembly member 546 is continuously connected with the transmission housing 560 through the interconnecting member 574.

[00116] The planet carrier assembly member 536 is selectively connectable with the ring gear member 544 through the clutch 550. The planet carrier assembly member 536 is selectively connectable with the sun gear member 542 through the clutch 552. The ring gear member 534 is selectively connectable with the sun gear member 542 through the clutch 554. The planet carrier assembly member 526 is selectively connectable with the ring gear member 544 through the clutch 556. The ring gear member 524 is selectively connectable with the transmission housing 560 through the clutch 557. The ring gear member 534 is selectively connectable with the

transmission housing 560 through the brake 558. The planet carrier assembly member 526 is selectively connectable with the transmission housing 560 through the brake 559.

[00117] The truth table shown in Figure 6b describes the engagement sequence and combination of the torque-transmitting mechanisms to provide three reverse speed ratios and nine forward speed ratios (as well as an extra seventh forward speed ratio (7')). The chart of Figure 6b describes the ratio steps between adjacent forward speed ratios and the ratio step between the third reverse (Reverse 3) and first forward speed ratios.

[00118] The sample speed ratios given in the truth table are determined utilizing the tooth ratio values also given in Figure 6b. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 520; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 530; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 540.

[00119] A powertrain 610, shown in Figure 7a, has the engine and torque converter 12, a planetary transmission 614 and the final drive mechanism 16. The planetary transmission 614 includes the input shaft 17, a planetary gear arrangement 618 and the output shaft 19. The planetary gear arrangement 618 includes three planetary gear sets 620, 630 and 640.

[00120] The planetary gear set 620 includes a sun gear member 622, a ring gear member 624, and a planet carrier assembly 626. The planet carrier assembly 626 includes a plurality of pinion gears 627 rotatably mounted on a carrier member 629 and disposed in meshing relationship with both the sun gear member 622 and the ring gear member 624.

[00121] The planetary gear set 630 includes a sun gear member 632, a ring gear member 634, and a planet carrier assembly member 636. The planet carrier assembly member 636 includes a plurality of pinion gears 637 rotatably mounted on a carrier member 639 and disposed in meshing relationship with both the sun gear member 632 and the ring gear member 634.

[00122] The planetary gear set 640 includes a sun gear member 642, a ring gear member 644, and a planet carrier assembly member 646. The planet carrier assembly member 646 includes a plurality of pinion gears 647 rotatably mounted on a carrier member 649 and disposed in meshing relationship with both the sun gear member 642 and the ring gear member 644.

[00123] The planetary gear arrangement 618 also includes seven torque-transmitting mechanisms 650, 652, 654, 656, 657, 658 and 659. The torque-transmitting mechanisms 650, 652, 654 and 656 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 657, 658 and 659 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00124] The input shaft 17 is continuously connected with the ring gear member 644, and the output shaft 19 is continuously connected with the planet carrier assembly member 636. The planet carrier assembly member 626 is continuously connected with the sun gear member 632 through the interconnecting member 670. The interconnecting member 670 may be one component or separate components. The ring gear member 624 is continuously connected with the ring gear member 634 through the interconnecting member 672. The interconnecting member 672 may be one component or separate components. The sun gear member 642 is continuously connected with the transmission housing 660 through the interconnecting member 674.

[00125] The planet carrier assembly member 626 is selectively connectable with the ring gear member 634 through the clutch 650. The planet carrier assembly member 626 is selectively connectable with the ring gear member 644 through the clutch 652. The sun gear member 632 is selectively connectable with the planet carrier assembly member 646 through the clutch 654. The sun gear member 622 is selectively connectable with the planet carrier assembly member 646 through the clutch 656. The ring gear member 624 is selectively connectable with the transmission housing 670 through the brake 657. The planet carrier assembly member 626 is selectively connectable with the transmission housing 660 through the brake 658. The sun gear member 622 is selectively connectable with the transmission housing 660 through the brake 659.

[00126] The truth table shown in Figure 7b describes the combination of torque-transmitting mechanism engagements that will provide a reverse drive ratio and eight forward speed ratios, as well as the sequence of these engagements and interchanges.

[00127] The ratio values given are by way of example and are established utilizing the ring gear/sun gear tooth ratios given in Figure 7b. For example, the  $N_{R1}/S_{R1}$  value is the tooth

ratio of the planetary gear set 620; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 630; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 640. The ratio steps between adjacent forward ratios and the reverse to first ratio are also given in Figure 7b. For example, the ratio step between the first and second forward ratio is 2.50. The torque-transmitting mechanism 656 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange.

[00128] A powertrain 710, shown in Figure 8a, has the conventional engine and torque converter 12, a planetary transmission 714, and the conventional final drive mechanism 16. The engine and torque converter 12 are drivingly connected with the planetary transmission 714 through the input shaft 17. The planetary transmission 714 is drivingly connected with the final drive mechanism 16 through the output shaft 19. The planetary transmission 714 includes a planetary gear arrangement 718 that has a first planetary gear set 720, a second planetary gear set 730, and a third planetary gear set 740.

[00129] The planetary gear set 720 includes a sun gear member 722, a ring gear member 724, and a planet carrier assembly 726. The planet carrier assembly 726 includes a plurality of pinion gears 727 rotatably mounted on a carrier member 729 and disposed in meshing relationship with both the sun gear member 722 and the ring gear member 724.

[00130] The planetary gear set 730 includes a sun gear member 732, a ring gear member 734, and a planet carrier assembly member 736. The planet carrier assembly member 736 includes a plurality of pinion gears 737 rotatably mounted on a carrier member 739 and disposed in meshing relationship with both the sun gear member 732 and the ring gear member 734.

[00131] The planetary gear set 740 includes a sun gear member 742, a ring gear member 744, and a planet carrier assembly member 746. The planet carrier assembly member 746 includes a plurality of pinion gears 747 rotatably mounted on a carrier member 749 and disposed in meshing relationship with both the sun gear member 742 and the ring gear member 744.

[00132] The planetary gear arrangement 718 also includes seven torque-transmitting mechanisms 750, 752, 754, 756, 757, 758 and 759. The torque-transmitting mechanisms 750, 752, 754 and 756 are rotating type torque-transmitting mechanisms, commonly termed clutches.

The torque-transmitting mechanisms 757, 758 and 759 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00133] The input shaft 17 is continuously connected with the sun gear member 742 and the output shaft 19 is continuously connected with the ring gear member 724. The ring gear member 724 is continuously connected with the planet carrier assembly member 736 through the interconnecting member 770. The planet carrier assembly member 726 is continuously connected with the ring gear member 734 through the interconnecting member 772. The ring gear member 744 is continuously connected with the transmission housing 760 through the interconnecting member 774.

[00134] The planet carrier assembly member 726 is selectively connectable with the sun gear member 742 through the clutch 750. The planet carrier assembly member 726 is selectively connectable with the planet carrier assembly member 746 through the clutch 752. The ring gear member 724 is selectively connectable with the sun gear member 742 through the clutch 754. The sun gear member 722 is selectively connectable with the planet carrier assembly member 746 through the clutch 756. The ring gear member 734 is selectively connectable with the transmission housing 760 through the brake 757. The sun gear member 722 is selectively connectable with the transmission housing 760 through the brake 758. The sun gear member 732 is selectively connectable with the transmission housing 760 through the brake 759.

[00135] The truth table of Figure 8b defines the torque-transmitting mechanism engagement sequence utilized for each of the eight forward speed ratios and the reverse speed ratio. Also given in the truth table is a set of numerical values that are attainable with the present invention utilizing the ring gear/sun gear tooth ratios given in Figure 8b. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 720; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 730; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 740. The torque-transmitting mechanism 756 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange.

[00136] Figure 8b also provides a chart of the ratio steps between adjacent forward ratios and between the reverse and first forward ratio. For example, the ratio step between the first and second forward ratios is 1.44.

[00137] A powertrain 810, shown in Figure 9a, has the conventional engine and torque converter 12, a planetary transmission 814, and the final drive mechanism 16. The engine and torque converter 12 are drivingly connected with the planetary transmission 814 through the input shaft 17. The planetary transmission 814 is drivingly connected with the final drive mechanism 16 through the output shaft 19. The planetary transmission 814 includes a planetary gear arrangement 818 that has a first planetary gear set 820, a second planetary gear set 830, and a third planetary gear set 840.

[00138] The planetary gear set 820 includes a sun gear member 822, a ring gear member 824, and a planet carrier assembly 826. The planet carrier assembly 826 includes a plurality of pinion gears 827 rotatably mounted on a carrier member 829 and disposed in meshing relationship with both the sun gear member 822 and the ring gear member 824.

[00139] The planetary gear set 830 includes a sun gear member 832, a ring gear member 834, and a planet carrier assembly member 836. The planet carrier assembly member 836 includes a plurality of pinion gears 837 rotatably mounted on a carrier member 839 and disposed in meshing relationship with both the sun gear member 832 and the ring gear member 834.

[00140] The planetary gear set 840 includes a sun gear member 842, a ring gear member 844, and a planet carrier assembly member 846. The planet carrier assembly member 846 includes a plurality of pinion gears 847 rotatably mounted on a carrier member 849 and disposed in meshing relationship with both the sun gear member 842 and the ring gear member 844.

[00141] The planetary gear arrangement 818 also includes seven torque-transmitting mechanisms 850, 852, 854, 856, 857, 858 and 859. The torque-transmitting mechanisms 850, 852, 854 and 856 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 857, 858 and 859 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00142] The input shaft 17 is continuously connected with the sun gear member 842 and the output shaft 19 is continuously connected with the ring gear member 824. The sun gear member 822 is continuously connected with the ring gear member 834 through the interconnecting member 870. The interconnecting member 870 may be one component or separate components. The planet carrier assembly member 826 is continuously connected with the planet carrier assembly member 836 through the interconnecting member 872. The ring gear member 844 is continuously connected with the transmission housing 860 through the interconnecting member 874.

[00143] The planet carrier assembly member 836 is selectively connectable with the sun gear member 842 through the clutch 850. The planet carrier assembly member 836 is selectively connectable with the planet carrier assembly member 846 through the clutch 852. The ring gear member 834 is selectively connectable with the planet carrier assembly member 846 through the clutch 854. The sun gear member 832 is selectively connectable with the sun gear member 842 through the clutch 856. The planet carrier assembly member 826 is selectively connectable with the transmission housing 860 through the brake 857. The sun gear member 822 is selectively connectable with the transmission housing 860 through the brake 858. The sun gear member 832 is selectively connectable with the transmission housing 860 through the brake 859.

[00144] The truth table shown in Figure 9b defines the torque-transmitting mechanism engagement sequence that provides the reverse speed ratio and ten forward speed ratios (as well as an extra seventh forward speed ratio (7')) shown in the truth table and available with the planetary gear arrangement 818. A sample of numerical values for the individual ratios is also given in the truth table of Figure 9b. These numerical values have been calculated using the ring gear/sun gear tooth ratios also given by way of example in Figure 9b. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 820; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 830; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 840. It can be readily recognized from the truth table that all of the single step and double step forward interchanges are of the single transition variety. Figure 9b also describes the ratio steps between adjacent

forward ratios and between the reverse and first forward ratio. For example, the ratio step between the first and second forward ratios is 1.66.

[00145] The powertrain 910, shown in Figure 10a, includes the conventional engine and torque converter 12, a planetary transmission 914, and the conventional final drive mechanism 16. The engine and torque converter 12 are drivingly connected with the planetary transmission 914 through the input shaft 17. The planetary transmission 914 is drivingly connected with the final drive mechanism 16 through the output shaft 19. The planetary transmission 914 includes a planetary gear arrangement 918 that has a first planetary gear set 920, a second planetary gear set 930, and a third planetary gear set 940.

[00146] The planetary gear set 920 includes a sun gear member 922, a ring gear member 924, and a planet carrier assembly 926. The planet carrier assembly 926 includes a plurality of pinion gears 927 that are rotatably mounted on a carrier member 929 and disposed in meshing relationship with the sun gear member 922. Pinion gears 928 are disposed in meshing relationship with both the ring gear member 924 and the pinion gears 927.

[00147] The planetary gear set 930 includes a sun gear member 932, a ring gear member 934, and a planet carrier assembly member 936. The planet carrier assembly member 936 includes a plurality of pinion gears 937 rotatably mounted on a carrier member 939 and disposed in meshing relationship with both the sun gear member 932 and the ring gear member 934.

[00148] The planetary gear set 940 includes a sun gear member 942, a ring gear member 944, and a planet carrier assembly member 946. The planet carrier assembly member 946 includes a plurality of pinion gears 947 rotatably mounted on a carrier member 949 and disposed in meshing relationship with both the sun gear member 942 and the ring gear member 944.

[00149] The planetary gear arrangement 918 also includes seven torque-transmitting mechanisms 950, 952, 954, 956, 957, 958 and 959. The torque-transmitting mechanisms 950, 952, 954 and 956 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 957, 958 and 959 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00150] The input shaft 17 is continuously connected with the sun gear member 942, and the output shaft 19 is continuously connected with the ring gear member 924. The planet carrier assembly member 926 is continuously connected with the planet carrier assembly member 936 through the interconnecting member 970. The interconnecting member 970 may be one component or separate components. The sun gear member 922 is continuously connected with the sun gear member 932 through the interconnecting member 972. The interconnecting member 972 may be one component or separate components. The ring gear member 944 is continuously connected with the transmission housing 960 through the interconnecting member 974.

[00151] The ring gear member 924 is selectively connectable with the sun gear member 922 through the clutch 950. The sun gear member 932 is selectively connectable with the sun gear member 942 through the clutch 952. The planet carrier assembly member 936 is selectively connectable with the planet carrier assembly member 946 through the clutch 954. The ring gear member 934 is selectively connectable with the planet carrier assembly member 946 through the clutch 956. The sun gear member 932 is selectively connectable with the transmission housing 960 through the brake 957. The planet carrier assembly member 926 is selectively connectable with the transmission housing 960 through the brake 958. The ring gear member 934 is selectively connectable with the transmission housing 960 through the brake 959.

[00152] The truth table of Figure 10b describes the torque-transmitting mechanism engagement sequence utilized to provide a reverse speed ratio and eight forward speed ratios (as well as an extra fourth forward speed ratio (4')). The truth table also provides a set of examples for the ratios for each of the reverse and forward speed ratios. These numerical values have been determined utilizing the ring gear/sun gear tooth ratios given in Figure 10b. The  $N_{R1}/S_{R1}$  value is the tooth ratio of the planetary gear set 920; the  $N_{R2}/S_{R2}$  value is the tooth ratio of the planetary gear set 930; and the  $N_{R3}/S_{R3}$  value is the tooth ratio of the planetary gear set 940. As can also be determined from the truth table of Figure 10b, each of the single step and double step forward interchanges are of the single transition variety. Additionally, the torque-transmitting mechanism 956 remains engaged through the neutral position, thus simplifying the forward/reverse interchange.

[00153] A powertrain 1010, shown in Figure 11a, includes the conventional engine and torque converter 12, a planetary transmission 1014, and the conventional final drive mechanism 16. The engine and torque converter 12 are drivingly connected with the planetary transmission 1014 through the input shaft 17. The planetary transmission 1014 is drivingly connected with the final drive mechanism 16 through the output shaft 19. The planetary transmission 1014 includes a planetary gear arrangement 1018 that has a first planetary gear set 1020, a second planetary gear set 1030, and a third planetary gear set 1040.

[00154] The planetary gear set 1020 includes a sun gear member 1022, a ring gear member 1024, and a planet carrier assembly member 1026. The planet carrier assembly member 1026 includes a plurality of pinion gears 1027 rotatably mounted on a carrier member 1029 and disposed in meshing relationship with both the sun gear member 1022 and the ring gear member 1024.

[00155] The planetary gear set 1030 includes a sun gear member 1032, a ring gear member 1034, and a planet carrier assembly member 1036. The planet carrier assembly member 1036 includes a plurality of pinion gears 1037 rotatably mounted on a carrier member 1039 and disposed in meshing relationship with both the sun gear member 1032 and the ring gear member 1034.

[00156] The planetary gear set 1040 includes a sun gear member 1042, a ring gear member 1044, and a planet carrier assembly member 1046. The planet carrier assembly member 1046 includes a plurality of pinion gears 1047 rotatably mounted on a carrier member 1049 and disposed in meshing relationship with both the sun gear member 1042 and the ring gear member 1044.

[00157] The planetary gear arrangement 1018 also includes seven torque-transmitting mechanisms 1050, 1052, 1054, 1056, 1057, 1058 and 1059. The torque-transmitting mechanisms 1050, 1052, 1054 and 1056 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 1057, 1058 and 1059 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00158] The input shaft 17 is continuously connected with the ring gear member 1044, and the output shaft 19 is continuously connected with the ring gear member 1024. The planet carrier assembly member 1026 is continuously connected with the ring gear member 1034 through the interconnecting member 1070. The ring gear member 1024 is continuously connected with the planet carrier assembly member 1036 through the interconnecting member 1072. The sun gear member 1042 is continuously connected with the transmission housing 1060 through the interconnecting member 1074.

[00159] The ring gear member 1034 is selectively connectable with the planet carrier assembly member 1046 through the clutch 1050. The sun gear member 1022 is selectively connectable with the planet carrier assembly member 1046 through the clutch 1052. The sun gear member 1032 is selectively connectable with the planet carrier assembly member 1046 through the clutch 1054. The sun gear member 1032 is selectively connectable with the ring gear member 1044 through the clutch 1056. The planet carrier assembly member 1026 is selectively connectable with the transmission housing 1060 through the brake 1057. The sun gear member 1022 is selectively connectable with the transmission housing 1060 through the brake 1058. The sun gear member 1032 is selectively connectable with the transmission housing 1060 through the brake 1059.

[00160] The truth table shown in Figure 11b describes the engagement combinations and the engagement sequence necessary to provide one reverse drive ratio and the eight forward speed ratios (as well as an extra fourth forward speed ratio (4')). A sample of the numerical values for the ratios is also provided in the truth table of Figure 11b. These values are determined utilizing the ring gear/sun gear tooth ratios also given in Figure 11b. The  $N_{R1}/S_{R1}$  value is the tooth ratio for the planetary gear set 1020; the  $N_{R2}/S_{R2}$  value is the tooth ratio for the planetary gear set 1030; and the  $N_{R3}/S_{R3}$  value is the tooth ratio for the planetary gear set 1040. The torque-transmitting mechanism 1057 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange. Also given in Figure 11b is a chart describing the step ratios between the adjacent forward speed ratios and the reverse to first forward speed ratio.

[00161] A powertrain 1110, shown in Figure 12a, includes the conventional engine and torque converter 12, a planetary transmission 1114, and the conventional final drive mechanism 16. The engine and torque converter 12 are drivingly connected with the planetary transmission 1114 through the input shaft 17. The planetary transmission 1114 is drivingly connected with the final drive mechanism 16 through the output shaft 19. The planetary transmission 1114 includes a planetary gear arrangement 1118 that has a first planetary gear set 1120, a second planetary gear set 1130, and a third planetary gear set 1140.

[00162] The planetary gear set 1120 includes a sun gear member 1122, a ring gear member 1124, and a planet carrier assembly 1126. The planet carrier assembly 1126 includes a plurality of pinion gears 1127 rotatably mounted on a carrier member 1129 and disposed in meshing relationship with both the sun gear member 1122 and the ring gear member 1124.

[00163] The planetary gear set 1130 includes a sun gear member 1132, a ring gear member 1134, and a planet carrier assembly member 1136. The planet carrier assembly member 1136 includes a plurality of pinion gears 1137 rotatably mounted on a carrier member 1139 and disposed in meshing relationship with both the sun gear member 1132 and the ring gear member 1134.

[00164] The planetary gear set 1140 includes a sun gear member 1142, a ring gear member 1144, and a planet carrier assembly member 1146. The planet carrier assembly member 1146 includes a plurality of pinion gears 1147 rotatably mounted on a carrier member 1149 and disposed in meshing relationship with both the sun gear member 1142 and the ring gear member 1144.

[00165] The planetary gear arrangement 1118 also includes seven torque-transmitting mechanisms 1150, 1152, 1154, 1156, 1157, 1158 and 1159. The torque-transmitting mechanisms 1150, 1152, 1154 and 1156 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 1157, 1158 and 1159 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00166] The input shaft 17 is continuously connected with the sun gear member 1142, and the output shaft 19 is continuously connected with the planet carrier assembly member 1136.

The planet carrier assembly member 1126 is continuously connected with the ring gear member 1134 through the interconnecting member 1170. The ring gear member 1124 is continuously connected with the planet carrier assembly member 1136 through the interconnecting member 1172. The ring gear member 1144 is continuously connected with the transmission housing 1160 through the interconnecting member 1174.

[00167] The ring gear member 1134 is selectively connectable with the planet carrier assembly member 1146 through the clutch 1150. The sun gear member 1122 is selectively connectable with the planet carrier assembly member 1146 through the clutch 1152. The sun gear member 1132 is selectively connectable with the planet carrier assembly member 1146 through the clutch 1154. The sun gear member 1132 is selectively connectable with the sun gear member 1142 through the clutch 1156. The planet carrier assembly member 1126 is selectively connectable with the transmission housing 1160 through the brake 1157. The sun gear member 1122 is selectively connectable with the transmission housing 1160 through the brake 1158. The sun gear member 1132 is selectively connectable with the transmission housing 1160 through the brake 1159.

[00168] The truth table shown in Figure 12b describes the engagement combinations and the engagement sequence necessary to provide one reverse speed ratio and the nine forward speed ratios. A sample of the numerical values for the ratios is also provided in the truth table of Figure 12b. These values are determined utilizing the ring gear/sun gear tooth ratios also given in Figure 12b. The  $N_{R1}/S_{R1}$  value is the tooth ratio for the planetary gear set 1120; the  $N_{R2}/S_{R2}$  value is the tooth ratio for the planetary gear set 1130; and the  $N_{R3}/S_{R3}$  value is the tooth ratio for the planetary gear set 1140. The torque-transmitting mechanism 1157 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange. Also given in Figure 12b is a chart describing the step ratios between the adjacent forward speed ratios and the reverse to first forward speed ratio.

[00169] A powertrain 1210, shown in Figure 13a, includes the conventional engine and torque converter 12, a planetary transmission 1214, and the conventional final drive mechanism 16. The engine and torque converter are drivingly connected with the planetary transmission

1214 through the input shaft 17. The planetary transmission 1214 is drivingly connected with the final drive mechanism 16 through the output shaft 19. The planetary transmission 1214 includes a planetary gear arrangement 1218 that has a first planetary gear set 1220, a second planetary gear set 1230, and a third planetary gear set 1240.

[00170] The planetary gear set 1220 includes a sun gear member 1222, a ring gear member 1224, and a planet carrier assembly 1226. The planet carrier assembly 1226 includes a plurality of pinion gears 1227 rotatably mounted on a carrier member 1229 and disposed in meshing relationship with both the sun gear member 1222 and the ring gear member 1224.

[00171] The planetary gear set 1230 includes a sun gear member 1232, a ring gear member 1234, and a planet carrier assembly member 1236. The planet carrier assembly member 1236 includes a plurality of pinion gears 1237 rotatably mounted on a carrier member 1239 and disposed in meshing relationship with both the sun gear member 1232 and the ring gear member 1234.

[00172] The planetary gear set 1240 includes a sun gear member 1242, a ring gear member 1244, and a planet carrier assembly member 1246. The planet carrier assembly member 1246 includes a plurality of pinion gears 1247 rotatably mounted on a carrier member 1249 and disposed in meshing relationship with both the sun gear member 1242 and the ring gear member 1244.

[00173] The planetary gear arrangement 1218 also includes seven torque-transmitting mechanisms 1250, 1252, 1254, 1256, 1257, 1258 and 1259. The torque-transmitting mechanisms 1250, 1252, 1254 and 1256 are rotating type torque-transmitting mechanisms, commonly termed clutches. The torque-transmitting mechanisms 1257, 1258 and 1259 are stationary-type torque-transmitting mechanisms, commonly termed brakes or reaction clutches.

[00174] The input shaft 17 is continuously connected with the sun gear member 1242, and the output shaft 19 is continuously connected with the ring gear member 1224. The planet carrier assembly member 1226 is continuously connected with the ring gear member 1234 through the interconnecting member 1270. The ring gear member 1224 is continuously connected with the planet carrier assembly member 1236 through the interconnecting member

1272. The ring gear member 1244 is continuously connected with the transmission housing 1260 through the interconnecting member 1274.

[00175] The planet carrier assembly member 1226 is selectively connectable with the planet carrier assembly member 1236 through the clutch 1250. The planet carrier assembly member 1226 is selectively connectable with the sun gear member 1242 through the clutch 1252. The planet carrier assembly member 1226 is selectively connectable with the planet carrier assembly member 1246 through the clutch 1254. The sun gear member 1222 is selectively connectable with the planet carrier assembly member 1246 through the clutch 1256. The planet carrier assembly member 1226 is selectively connectable with the transmission housing 1260 through the brake 1257. The sun gear member 1222 is selectively connectable with the transmission housing 1260 through the brake 1258. The sun gear member 1232 is selectively connectable with the transmission housing 1260 through the brake 1259.

[00176] The truth table shown in Figure 13b describes the engagement combinations and the engagement sequence necessary to provide one reverse speed ratio and the eight forward speed ratios. A sample of the numerical values for the ratios is also provided in the truth table of Figure 13b. These values are determined utilizing the ring gear/sun gear tooth ratios also given in Figure 13b. The  $N_{R1}/S_{R1}$  value is the tooth ratio for the planetary gear set 1220; the  $N_{R2}/S_{R2}$  value is the tooth ratio for the planetary gear set 1230; and the  $N_{R3}/S_{R3}$  value is the tooth ratio for the planetary gear set 1240. Also given in Figure 13b is a chart describing the step ratios between the adjacent forward speed ratios and the reverse to first forward speed ratio. The torque-transmitting mechanism 1256 remains engaged through the neutral condition, thus simplifying the forward/reverse interchange.

[00177] While the best modes for carrying out the invention have been described in detail, those familiar with the art to which this invention relates will recognize various alternative designs and embodiments for practicing the invention within the scope of the appended claims.
